

HyBalance

Turning low-priced electricity from wind turbines into green hydrogen

July 2018

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forskel.dk

HyBalance

Danish minister cut the first sod

- The green transition of the energy system requires the integration of multiple energy technologies – including hydrogen.
- On 4 April 2016, the Danish Minister for Energy, Utilities and Climate, Lars Christian Lilleholt, cut the first sod for the hydrogen facility together with the mayor of Mariagerfjord, Mogens Jespersen.
- The minister said: *“Hydrogen is one of the technologies which we will focus on in the future. Therefore I am very pleased that Denmark, with this facility, is positioning itself at the forefront. We will be able to show that we are leading the way. That it is not just talk but no action, but something that is taking place in the real world.”*

What is HyBalance?

- HyBalance is a project that will demonstrate the use of hydrogen in the energy system of the future:
 - Converting electricity from wind turbines into hydrogen from water electrolysis.
 - Enabling the storage of low priced renewable electricity from wind turbines.
 - Contributing to balancing the grid, which is important in order to ensure stability.
 - Using the green hydrogen in the transport sector and for industrial purposes.

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forskkel.dk

Partners in the HyBalance project

- Air Liquide, Copenhagen Hydrogen Network (CHN), Hydrogenics, Neas Energy, Hydrogen Valley, LBST

- HyBalance has a total budget of EUR 15 million. The project has received EUR 8 million in funding from the Fuel Cells and Hydrogen 2 Joint Undertaking, as well as EUR 2.6 million from the Danish ForskEL program, which is administered by Energinet.

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forsk-el.dk

Background: EU goals and challenges

- The EU is committed to a long-term climate policy, which prioritises a stable and independent energy supply – based on renewable energy.
- The share of renewable energy will rise. It is therefore crucial that we are able to store this renewable energy and use it in sectors which have been dependent on fossil fuels until now – such as the transport sector.
- Hydrogen is considered to be key to solving this challenge.

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forskkel.dk

Why has Denmark been chosen for the project?

- Denmark is one of the countries in the EU with the most ambitious energy policy.
- In June 2018, all parties in the Danish national parliament updated an energy agreement stating that:
 - By 2050, Denmark must be independent of fossil fuels
 - By 2030, the share of renewable energy must be 55%
 - By 2030, 100% of Denmark's electricity consumption must be covered by renewables
 - By 2030, 90% of district heating must be based on other types of energy than coal, oil & gas
- Denmark has a lot of wind energy.
- Denmark has know-how within FCH technologies.
- Denmark is the first and only country in the world to have a national network of hydrogen refueling stations.
- Hydrogen cars are exempt from taxes until 2019.

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish FORSKEL program, which is administered by Energinet.dk. www.forskkel.dk

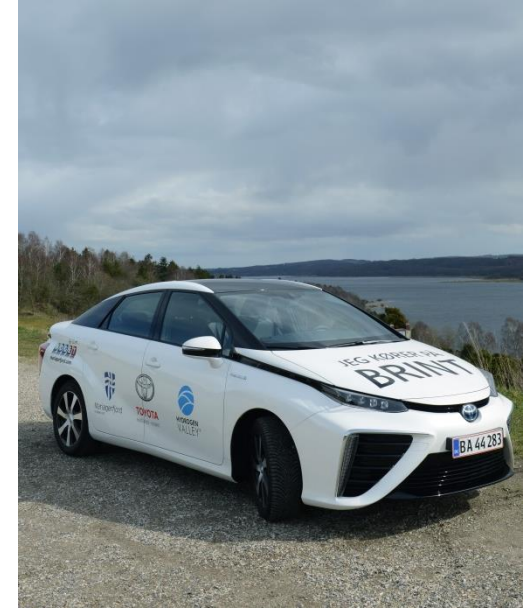

The need to balance the grid

- Wind energy fluctuates – the grid requires stability.
- During some periods we produce more electricity from wind turbines than we are able to use.
- The excess electricity production can be exported or the wind turbines can be stopped.
- Or the excess wind power can be stored by converting it into hydrogen.
- HyBalance will develop business models to determine when it will pay to convert the wind power into hydrogen.

Storing renewable energy

- By storing wind power as hydrogen, the energy from the wind turbines will be used to the fullest.
- And the end product – green hydrogen – can be used in the transport sector and for industrial purposes.

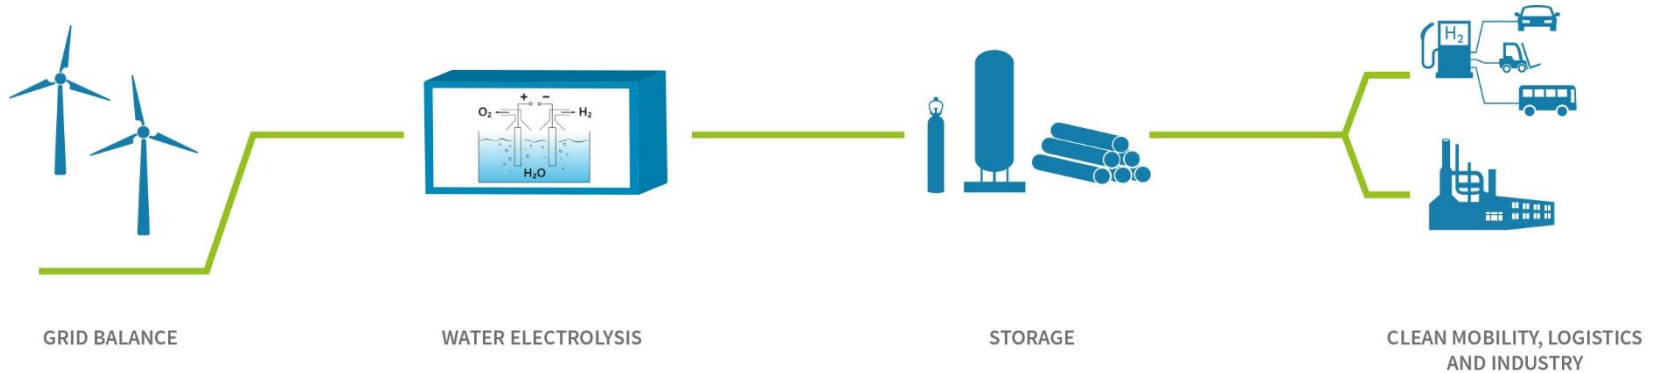

Hydrogen in the transport sector

- Hydrogen cars are coming.
- All the major car manufacturers have hydrogen cars on their agenda.
- Hydrogen cars emit only water and are easy and quick to refuel.
- Denmark has ten hydrogen refueling stations, which make it possible to reach every location by a hydrogen car.

The HyBalance process

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and Innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forskkel.dk

PEM Electrolysis

- PEM (Proton Exchange Membrane) electrolysis is characterised by high efficiency (hydrogen per kWh).
- The technology is flexible (fast start-up and no problems with frequent start/stop).
- This makes PEM very suitable for balancing fluctuating energy sources.
- HyBalance will validate dynamic PEM electrolysis.

Schedule for HyBalance

- Construction of the hydrogen facility started in 2016.
- The facility will be inaugurated on September 3rd 2018.

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forsk.dk

The potential: supply for the transport sector

- The facility will be able to produce 230 Nm³/h hydrogen (approximately 500 kg/day).
- This production will be enough for 1,000 hydrogen cars.
- Production for hydrogen busses and forklifts as well.
- Assumptions
 - More hydrogen cars will be rolled out
 - More hydrogen refueling stations will be build to meet the demand from more hydrogen cars.

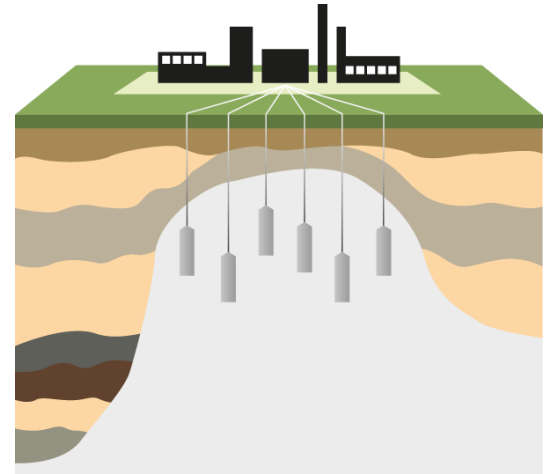

The HyBalance project has received funding from the Fuel Cells and Hydrogen 2 Joint Undertaking under grant agreement No 671384. The Joint Undertaking receives support from the European Union's Horizon 2020 research and innovation program and France, Germany, Denmark and Belgium. www.fch.europa.eu. The HyBalance project has furthermore received funding from the Danish ForskEL program, which is administered by Energinet.dk. www.forskEL.dk

The potential: large-scale storage of hydrogen

- The underground of the Northern part of Denmark holds unique opportunities for the storage of hydrogen in large scale: salt caverns.

Summing up: HyBalance will promote green transition

- HyBalance will convert power from wind turbines into hydrogen
- The hydrogen will be used in the transport and industrial sector
- HyBalance will develop business models which will determine when it pays off to turn the wind power into hydrogen
- HyBalance will validate the PEM technology
- HyBalance will establish how hydrogen can contribute to making Denmark independent of fossil fuels

Thank you for your attention
